

Progress Report 3 - Normalize Crosscorrelation

Joshnare A. Ong

Group Members: Raffy Colobong & Nathan Ocampo

ENGG 151.01 - C

September 7, 2026

Since the previous progress report, the normalized crosscorrelation function has been completed and integrated into the C++ program. The program now removes the averages of the input signals, computes their normalized crosscorrelation, and exports the resulting signal to an output file. Testing using the provided Basic Test produced the expected output for all lags.

Input validation and error handling were also improved and tested for different cases, including invalid inputs, missing files, comments, and signals without a specific starting index. At this point, the program is substantially complete. The remaining work consists of additional testing, checking the program if it completes the project requirements, and preparing the required files and documentation for final submission.
